

Semi Hood Attachment

LK4037

FEATURES

The Semi Hood Attachment LK# 4037 is a great option for collision shops and service shops when removing or installing a semi hood. With the aero dynamic designs the hood typically needs to be removed to perform collision repairs, replace injectors, clutch fans, radiators and for several other repairs. The average semi hood weighs between 180lbs and 230lbs, it is large, bulky and must be lifted up over the steer tires to remove or install. The Lift King with the Semi Hood Attachment allows one technician to easily remove or install in just a few minutes with no human lifting. Once the hood is off the semi, the hood can remain on the lift to perform repairs to the hood or to simply just hold it until the technician is ready to install it back on the semi. For busy shops that don't want to tie the Lift King up to simply hold the hood, the semi hood dolly is a great option to store the hood on and move it around the shop while keeping the Lift King open for the next lifting job.
